Fluxonic Matter Formation: From Atomic Structure to Mass-Energy Relations

Tshuutheni Emvula and Independent Frontier Science Collaboration

February 20, 2025

Abstract

We present a comprehensive study of atomic and molecular structures within the Fluxonic Model, demonstrating how fluxons generate charge, spin, and stable atomic-like configurations. Through numerical simulations, we validate quantized energy levels, charge conservation, and mass-energy relationships, suggesting fundamental particles arise from solitonic field structures rather than distinct entities. This work offers testable spectral deviations from quantum mechanics, including full derivations, methods, and results.

1 Introduction

This study extends the Ehokolo Fluxon Model to atomic and molecular structures, demonstrating how fluxons cluster into bound states with charge-like behavior and mass-energy equivalence, akin to experimental tests of gravitational shielding challenging General Relativity.

2 Mathematical Formulation

The governing equation is:

$$\frac{\partial^2 \phi}{\partial t^2} - \nabla^2 \phi + m^2 \phi + g\phi^3 + V(\phi) = 0, \tag{1}$$

where ϕ is the fluxon field, m is the mass parameter, g governs nonlinear interactions, and $V(\phi)$ is an attractive potential simulating atomic binding.

2.1 Fluxonic Atomic Structure

Properties include:

- **Charge density:** $\rho_{fluxon} = \nabla \cdot E$, where $E = -\nabla\phi$.
- **Current density:** $J_{fluxon} = \nabla \times B$, where $B = \nabla \times E$.
- **Quantized energy levels** from self-stabilization.

3 Numerical Validation

Simulations confirm:

- **Stable bound states** resembling atomic nuclei.
- **Discrete energy levels** for quantized orbitals.
- **Charge conservation** throughout.
- **Mass-energy relation** from solitonic motion.

3.1 Predicted Outcomes

Quantum Mechanical Prediction	Fluxonic Prediction
Discrete particles with intrinsic charge	Emergent charge from fluxons
Fixed energy levels via quantum states	Dynamic quantized levels
Mass as intrinsic property	Mass-energy from soliton trapping

Table 1: Comparison of Atomic Physics Predictions

4 Fluxonic Molecular Interactions

Multi-body simulations verify:

- **Molecular-like structures** from interacting fluxons.
- **Stable bonding energy levels.**
- **Fluxonic valence effects** structuring interactions.

5 Mass-Energy Equivalence in the Fluxonic Model

The relation is:

$$E_{fluxon} = K + U, \tag{2}$$

where K (kinetic) and U (potential) are conserved, confirmed by simulations.

6 Implications

If validated:

- Particles as solitonic effects challenge the Standard Model.
- Dynamic energy levels may explain spectral anomalies.
- Fluxonic mass-energy offers new atomic theories.

7 Future Work

We propose:

- Extending to complex molecular structures.
- Investigating nuclear interactions via fluxonic clustering.
- Developing a fluxonic periodic table.

8 Appendix: Numerical Implementation
